Descriptions

Ambulatory Care

The shift from inpatient to outpatient care continues to impact the delivery of basic healthcare in the U.S. today. Obtaining comprehensive information regarding ambulatory service utilization and demand is important to the development of appropriate provider networks and delivery systems to serve the needs of the population. These predictive datasets combine the most accurate utilization data, estimates, and projections for physician, hospital emergency, outpatient department services and ambulatory surgery cases by procedure to present a complete view of an ambulatory services market.

Uses

- Forecast the utilization of ambulatory services in an area by physician specialty.
- Estimate patient visits to hospital emergency and outpatient departments.
- Identify market opportunities by benchmarking actual utilization to expected norms.
- Project annual physician office visits by diagnosis and procedure.
- Analyze a site or market area for constructing new ambulatory healthcare delivery facilities.

Sources

National Ambulatory Medical Care Survey, National Hospital Ambulatory Medical Care Survey, National Health Interview Survey, Persistent Regional Differences Database, Medical Management Index and Trend Database and Applied Geographic Systems.

Behavioral Medicine

Behavioral healthcare often fails to receive attention commensurate with its impact on the nation's total healthcare picture. The treatment of behavioral disorders and substance abuse is highly managed and affects many other areas of care. There is a rapid shift towards delivering these services in the outpatient setting. These predictive datasets present the complete spectrum of mental health care.

Uses

- Project the potential outpatient population by diagnosis.
- Forecast the number of hospital admissions and bed days.
- Perform a needs assessment of mental health services for a covered population.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Ambulatory Medical Care Survey, National Hospital Discharge Survey, Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Cancer Care

The fight against cancer is a major focus of healthcare research. The death rate from malignant neoplasms continues to edge upward. Cancer is the second leading cause of death in this country for all age groups and the leading cause among the 45-64 age cohort. These predictive datasets focus on the treatment of cancer and provide a broad spectrum of information related to the most prevalent types of neoplasms. The information includes estimates and projections of physician utilization by diagnosis and diagnostic testing by site of service.

Uses

- Benchmark actual experience against expected norms.
- Estimate the potential for oncology related services.
- Project the number of hospital discharges.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Ambulatory Medical Care Survey, National Hospital Ambulatory Care Survey, National Hospital Discharge Survey, Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Cardiovascular Services

Heart disease affects more than fifty million Americans and is the leading cause of death for men and women in the U.S. today. Nowhere in medicine is timely access to services and facilities and the ability to accurately analyze the population more important. As the baby boom generation ages, heart disease will continue to be a significant concern despite the fact that cardiovascular mortality rates have declined over the past two decades. Cardiovascular care is witnessing a tremendous amount of innovation in the areas of diagnostic testing, invasive and noninvasive procedures, and pharmaceuticals. These predictive datasets provide estimates and projections of inpatient and outpatient cardiac procedures.

Uses

- Identify the need for new technologies and capital equipment.
- Evaluate the prevalence of cardiovascular conditions in a given population.
- Project the number of inpatient and outpatient cardiovascular related procedures.
- Forecast the expected inpatient population.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Health Interview Survey, National Ambulatory Medical Care Survey, National Survey of Ambulatory Surgery, National Hospital Discharge Survey, Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

DRG

Diagnosis Related Groups (DRGs) introduced by the Health Care Financing Administration are a means of grouping related conditions and stabilizing reimbursements. Payers and institutions use DRGs to measure utilization and allocate resources. They provide a convenient, standardized means for evaluating inpatient hospital care. The Major Diagnostic Category (MDC), classification is a roll-up of individual DRGs into groupings based primarily upon bodily systems. Currently, there are 25 MDCs.

DRG caseload estimates are developed from the total DRG universe incorporating admissions from all ages and all payer types. These predictive datasets present inpatient discharge estimates that are more representative of the total population in a market than similar estimates created solely with Medicare data.

Uses

- Project the potential inpatient volume in your market.
- Develop market share estimates.
- Benchmark actual experience against expected norms.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Hospital Discharge Survey, HCUP-3 (Release 2), Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Eye Care

The highest volume of ambulatory procedures are those related to eye treatment. These predictive datasets contain diagnostic and procedural level data estimates and projections for both inpatient and office-based care including optometric dispensing and ambulatory surgical procedures.

Uses

- Forecast the need for ophthalmologists within a given population.
- Estimate the total market for all types of eye treatment.
- Project the potential procedural volume.
- Analyze the market for optometric services.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Ambulatory Medical Care Survey, National Hospital Discharge Survey, Persistent Regional Differences Database, National Survey of Ambulatory Surgery, Medical Management Index and Trend Database and Applied Geographic Systems.

Pediatric

Pediatric patients require different services from that of adult patients. Proper pediatric care is critical in preventing the development of serious conditions and controlling costs incurred by this segment of the population. These predictive datasets contain estimates and projections on a broad variety of inpatient and outpatient data to provide a comprehensive overview of this important market segment including ambulatory surgery cases.

Uses

- Project the potential pediatric inpatient and outpatient population.
- Forecast the expected volume of procedures.
- Estimate physician utilization by diagnosis and specialty.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Hospital Discharge Survey, National Hospital Ambulatory Medical Care Survey, National Ambulatory Medical Care Survey, National Health Interview Survey, National Survey of Ambulatory Surgery Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Rehabilitation

Rehabilitative care is an important component of healthcare. It is increasingly specialized and subjected to the pressures of managed care. There is a shift away from acute care services towards outpatient long-term care. These descriptive datasets describe the orthopedic and neurological specialties, as they are the primary points of entry into rehabilitative care.

The DRG caseload estimates focuses on those DRGs as identified by ABI Associates in a study of subacute care in free-standing skilled nursing facilities. The study revealed that many of these DRGs were treatable in long-term care facilities with subacute programs.

Uses

- Project the potential rehabilitation patient population.
- Estimate the expected physical therapy patient volume.
- Forecast the orthopedic and neurological specialty patient volume.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Renal Care

Diabetes Mellitus is one of the top 10 causes of death among persons of all ages. Renal disease is a leading cause of death among persons age 65 and older. Diabetes can contribute to a constellation of health problems, such as ophthalmic conditions, vascular disease, non-healing wounds, and renal disease. End-stage renal disease (ESRD) can necessitate renal dialysis or kidney transplantation (by far the most common organ transplant). Treatment of diabetes and renal disease account for over 10% of healthcare expenditures. With access to appropriate services diabetes is a manageable and often preventable disease. These predictive datasets contain estimates and projections of renal and diabetes related services.

Uses

- Predict the need for new technologies and capital equipment
- Identify the prevalence of renal conditions in a specific population
- Project the demand for renal dialysis
- Forecast the expected diabetic populations.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

U.S. Renal Data System, National Ambulatory Medical Care Survey, National Hospital Ambulatory Medical Care Survey, National Hospital Discharge Survey, Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Respiratory

Diseases and disorders of the respiratory system are the second most common Major Diagnosis Category (MDC) in the United States. It is projected that over 3.4 million disorders and diseases of the respiratory system will be diagnosed in the year 2003. These predictive datasets include estimates and projections of the number of physician office visits, inpatient and outpatient hospital visits, and the general incidence of respiratory conditions.

Uses

- Forecast the need for respiratory services within a given population.
- Identify the prevalence of respiratory conditions for your region.
- Plan the resources necessary to meet inpatient and outpatient service demand.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

National Ambulatory Medical Care Survey, National Hospital Ambulatory Medical Care Survey, National Hospital Discharge Survey, National Survey of Ambulatory Surgery, National Health Interview Survey, Persistent Regional Differences Database, Medical Management Index and Trend Database, and Applied Geographic Systems.

Senior Care

Americans are living longer. The number of adults over 75, 85, and 95 years of age is increasing, a trend that will continue. Over the coming decades the baby boomers will be entering their golden years, increasing the need for senior services. The elderly require services that address a unique set of needs. The senior population often requires more frequent healthcare services, more temporary and permanent inpatient or institutional healthcare than younger adults and more general lifestyle services.

The physical health and psychosocial needs of older adults are more diverse and complex than any other segment of the population. Age-related changes combined with chronic health problems, acute illness and other life events create a need for gerontologically sound healthcare services. The majority of seniors rely upon Medicare for reimbursement of hospital and medical expenses. A dramatic shift to managed care within the Medicare program is affecting the delivery of care to this population. These predictive datasets contain extensive information related to the healthcare utilization characteristics of the senior population including estimates and projections of the number of ambulatory surgery cases.

Uses

- Project the potential for home health services.
- Estimate the expected market for senior health services.
- Analyze the relative mixture of long-term care services.
- Focus on and quantify your target population.
- Identify market opportunities by benchmarking actual utilization to expected norms.

Sources

Women's Care

Women receive approximately 60% of office-based and inpatient care, and often are the primary household decision makers for healthcare services. These predictive datasets provide a concise overview of the services unique to women. Utilization estimates are limited to women age 15 and older. They include estimates and projections of the number of ambulatory surgery cases performed on this distinct population.

Uses

- Forecast the potential inpatient and outpatient population for women's healthcare services.
- Quantify the need for physician office-based care.
- Estimate the expected demand for diagnostic and screening services by location.
- Identify market opportunities by benchmarking actual utilization to expected norms.
